scene, retrofitting an existing plant to incorporate this allergen into the current product mix can be challenging. Here

PROCESSING

_____—Process engineers can often evaluate and provide recommendations to reconfigure existing production areas to include a dedicated allergen line. Ideally, each line should also have its own HVAC and/or refrigeration system to effectively control airflow between areas. A full separation of lines will allow other lines

_____—Dry-mixing and dry-blending areas should be housed separately. Airflow should be

_____—Non-allergenic products should be scheduled first followed by allergen products. A scheduling matrix can help minimize clean-in-place (CIP) and changeover time between batches.

STORAGE

_____—Room modifications may be made to create separate storage areas for allergen

Hazard Analysis and Critical Control Points Plan (HACCP) —Allergen control should be included as part of the plant's HACCP plan. Assess the plant's allergen and develop a detailed plan for addressing those risks. Conduct internal

As a result, food producers often find themselves saddled with too many different products, or SKUs, all in an effort to appease customers. Too many SKUs can drag down profits with frequent changeovers that drive up production costs and decrease throughput. Here are ways to manage multiple SKUs:

SALES

2. Detail the process for adding additional SKUs to your product mix. Can a sales representative create a new SKU,

ANALYZE SKUS OFTEN

1. Conduct an asset optimization study. Assess how your plant's assets are being utilized, or underutilized, based on capacity and profit margin.
2. Is there an opportunity to combine two similar SKUs while satisfying customer demands? Can you eliminate a SKU?
3. Determine your most / least profitable SKUs and set a threshold for eliminating those that may be dragging down profits.

PRODUCTION SCHEDULING

1. Incorporate production scheduling into your plan and review it frequently. Can you process extra runs of the same SKU?
2. Consider putting freezes on your production schedule for one or two days to avoid any last-minute customer orders.

REDUCE CHANGEOVERS

1. Fewer SKUs mean fewer changeovers. Conduct a manufacturing analysis to determine...
 - Single-serve or tray packs.
 - Case size consolidation, on line printing and label application.
- Consumer and retailer demand for specialty products will continue to increase. Maintaining your company's strategic integrity and profits, while continuing to meet customers' needs, requires a balance in sales and production.
